

eu.bac Press Release

**eu.bac - Economical heating products
- Energy-efficient solutions in buildings**

A European-wide voluntary energy labelling scheme is being introduced by eu.bac for building services products that deliver heating regulation and hydraulic balancing, and which are not currently covered by EU labelling regulations. This labelling is open for uptake by all manufacturers.

Based on European standards and regulations, this labelling allows for improved decision-making by private households, specifiers, installers, specialist retailers - and public authorities, as well as district heating and energy suppliers. The label displays at glance information regarding the product quality in terms of energy saving - and functionality.

The label is built upon existing independent test house analysis of temperature controllers and valves for heating systems. The periodic examination demonstrates that the controls industry is aware of the need for quality assurance. In addition, production facilities are regularly checked and product samples taken. Certification according to ISO 9000 is a prerequisite for the eu.bac labelling. Already, more than 200 products have been certified and registered.

Process to obtain the eu.bac European label

Accredited laboratories test the accuracy and functionality of the controller. Only products and controllers which meet the requirements of European standards as well as internal production requirements can obtain the eu.bac energy efficiency label.
